

HYDRAULIC PILE DRIVER

Sized to suit customer application

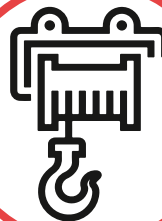

Hydraulic control with remote

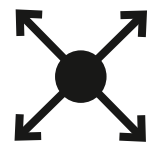

Available to suit multiple applications

Pile driver units are set up to operate attached to mobile equipment including excavators and tractors. Current designs allow for attachment to excavators via quick hitch can be fitted to excavators as small as 8 tonne allowing for maneuverability on small sites while still driving piles up to 4m in length

Pile drivers are mounted to an adjustable base which allows for piles to be driven in square on uneven ground. Guide bars up the length of the boom are spaced at 500mm increments to quickly gauge driving depth at a safe distance. Hydraulic control is by remote control, ensuring the operator remains clear.

Pile driver design is scalable and allows for different methods of attachment to allow interchangeability between equipment. Hydraulic lines are connected with quick release couplings and all controls equipment is housed on the driver.
